

Hosted Servers

Virtual, Resilient, Scalable and Fast

Virtual Server Infrastructure (IaaS)

Virtual server and Infrastructure as a Service (IaaS) models challenge traditional infrastructure deployment methods by allowing companies to take some or all of their infrastructure off-site and benefit from lower TCO, higher performance, full scalability and enterprise grade reliability.

Virtual servers represent the next generation of server environment, replacing the conventional concept of the dedicated or managed server. We provide server resources that look and act just like a dedicated server but, because we utilise a Grid and virtualisation computing system, they are scalable on demand, ready to meet the needs of your business at any given moment. You control the amount of resources you use but without having to pay for hardware when it's not needed

We firmly believe that our dynamic servers are the most efficient way to run your applications, taking advantage of the latest developments in server and software technology to give you affordable access to an on-demand computing model.

Consolidating your existing servers?

So how can you increase system efficiency, rapidly deploy new systems to address business needs and still reduce the associated capital and operational costs? Easy – look no further than We are Cloud.
